## Analytical Mechanics Final Exam．

1．A bead of mass $m$ is constrained to slide along a thin，circular hoop of radius $l$ ．The hoop rotates with a constant angular velocity $\omega$ in a horizontal plane around point $O$ on its rim，as illustrated in Figure 1.

Figure 1：Bead moving along hoop
（a）Find the Lagrange equation of motion of the bead．
（b）Let $O^{\prime}$ be the point on the hoop rim diamet－ rically opposite to point $O$ ．Show that the bead oscillates like a simple pendulum about point $O^{\prime}$ ．

2．Let us investigate the transversal vibration of a beam．The beam is of length $L$ and its one end is fixed on a wall，as illustrated in Figure 2. Force $f(t)$ is applied to the other end at time $t$ ． Let $\mu$ be the line density of the beam，$E$ be its Young＇s module，and $I$ be its geometrical mo－ ment of inertia．Let $x$ be the distance from the wall and $u(x, t)$ be the traversal displacement
at distance $x$ and time $t$ ，as illustrated in the figure．Kinetic energy and bend potential en－ ergy of the beam are then described as follows， respectively：

$$
\begin{aligned}
& T=\int_{0}^{L} \frac{1}{2} \mu\left(\frac{\partial u}{\partial t}\right)^{2} d x \\
& U=\int_{0}^{L} \frac{1}{2} E I\left(\frac{\partial^{2} u}{\partial x^{2}}\right)^{2} d x
\end{aligned}
$$

Work done by the external force is described as

$$
\text { Work }=f(t) u(L, t) .
$$

Compute the variation of action integral

$$
\delta \int_{t_{1}}^{t_{2}}(T-U+W \text { ork }) d t
$$

and derive a differential equation that $u(x, t)$ must satisfy．

Figure 2：Transversal vibration of beam

| transversal vibration | 横振動 |
| :--- | :--- |
| line density | 線密度 |
| Young＇s module | ヤング率 |
| geometrical moment |  |
| of inertia |  |
| action integral | 断面二次モーメント |
| 作用積分 |  |
