研究課題名：Estimating Glioma Grading using a multi-task deep learning model with IDH genotype self-prompt

# 「Glioma Grading using a multi-task deep learning model with IDH genotype self-prompt」

## Background

A computer diagnosis system predicting the IDH genotype and Glioma (brain tumor) grade could help doctors for surgery.

## Challenge points

Multi-modal brain data have rich information for prediction.

Difficult to predict genotype and grades.

Two challenges

Medical dataset do not large enough to obtain a good results.

## Research objectives

AI foundation model trained by a huge dataset, which can achieve a better results on various task. (ex. ChatGPT)

## Research plan

First Year

Multimodal brain MRI fusion foundation model

IDH status prediction

Second Year

Multi-task self-prompt AI model for glioma diagnosis

IDH status prediction

Grade I, II, III, IV

With AI foundation model the dataset problems can be solved.

With IDH genotype self-prompting, the diagnosis of tumor grades can be better.
